Index

Part I: Diagnosis Index
Part II: Operation Index
Part III: Crosswalk

If a diagnosis or operation does not appear in the Index, its corresponding *ICD-9-CM* code can be found in the *International Classification of Diseases, 9th Revision, Clinical Modification*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1988, *Volume 2 Diseases: Alphabetic Index or Volume 3 Procedures: Tabular List and Alphabetic Index*. New *ICD-9-CM* codes added in 1988 are reflected in this index.

This book is one volume in a set of seven books presenting statistics on hospital stay during 1988 in the United States. The complete set is the latest in a series of publications on length of stay in hospitals that participate in the Professional Activity Study (PAS) of the Commission on Professional and Hospital Activities. Data from other organizations contributing to CPHA are included in the 1988 series.

These statistics, also available on magnetic tape, provide a valuable perspective for utilization review and quality assurance professionals, physicians, consultants, hospital administrators, third party payors and researchers interested in cost containment and quality care.

Appreciation is extended to the hospitals and state organizations that supported this publication by making their data available.

INTRODUCTION

One of several divisions of TSM Computing Group, the newly established Healthcare Knowledge Systems (HKS) markets a line of high quality, information-oriented products and services to the healthcare industry and related fields. HKS is the official marketer and distributor of products derived from the clinical research and classification development of the Commission on Professional and Hospital Activities (CPHA).

HKS Publications offers a range of information products, available through books, magnetic media and educational seminars. The *Length of Stay* series is one of a number of data reference tools setting performance guidelines for a variety of healthcare settings. Now in its twenty-fifth year, and still drawn from CPHA's extensive database, *Length of Stay* remains the industry standard for inpatient normative data.

DESCRIPTION OF THE DATABASE

Source of the Data

Data in the Length of Stay tables were compiled from individual patient discharge records submitted by hospitals participating in the Professional Activity Study (PAS). In addition, discharge data from hospitals participating in information systems other than PAS are included.

The following steps describe the PAS method of storing and retrieving medical data:

1. In each participating hospital, personnel transfer data from the medical record of each discharged patient into the PAS System via PAS+ microcomputer, magnetic tape, or PAS Case Abstract.
2. The disk, tape, or abstract is mailed to the center of PAS operations in Ann Arbor, Michigan, where it is entered into the computer system.
3. Data undergo a comprehensive editing process and errors are corrected.
4. The computer system continually adds data to a permanent file. Participating hospitals are provided access to these data through interactive systems, in-house computers, and reports. The stored data are also available to researchers on a contractual basis.
5. Data are standardized to create an aggregated patient record base.

Annually these data are utilized to create the Length of Stay (LOS) series and other reference tools.

Data Quality

Data quality is a primary concern. Although the hospital has basic responsibility for the quality of PAS data, considerable effort is exerted to prevent and correct errors. Hospital medical records personnel are trained in coding and abstracting methods. Over 600 computer checks are performed during the processing of each record to ensure the reasonableness of the data. Examples of discrepancies detected by the audit are: hospital day of operative episode exceeding total stay, cesarean section with a normal delivery diagnosis, sex-specific diagnosis or operation with the wrong sex recorded, incalculable age or stay, unrecorded or invalid diagnosis. When illogical, invalid, or missing data are detected, about 40 percent of the errors are corrected by computer. The remainder are referred back to hospital staff through computer-generated error messages.

In addition to initial data editing, the computer system that produces the length of stay tables does numerous edits to eliminate uncorrected or unusual data. The following events cause a record to be excluded as not representing a typical short-term patient:

1. death
2. stillborn
3. admission from other short-term hospital
4. discharge to other short-term hospital
5. discharge against medical advice

Database Characteristics

Data chosen for inclusion in the Length of Stay series are from general, nonfederal, short-term hospitals in the United States. Short-term hospitals are defined as those in which the median stay is less than 30 days. General hospitals provide patient services for a variety of medical conditions. Data from long-term specialty institutions, e.g., long-term psychiatric or rehabilitation facilities, are excluded.

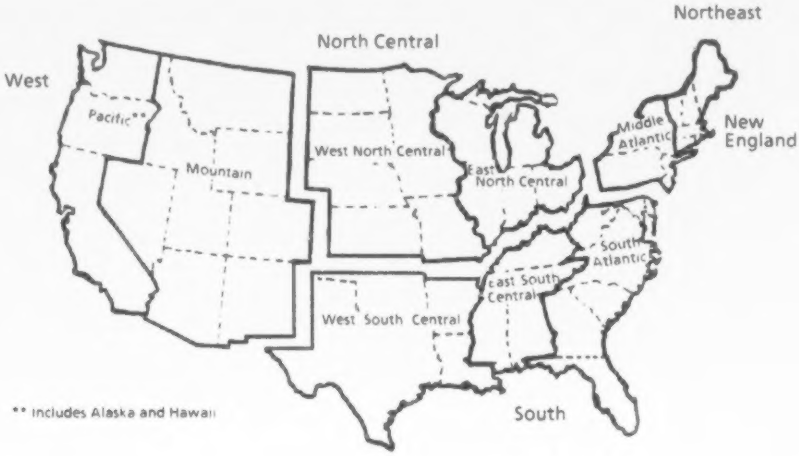
Most data used in the Length of Stay tables are from hospitals participating in PAS. In addition, the following organizations have sent data: Colorado Hospital Association, Hospital Association of New York State, Maine Hospital Association, Michigan Hospital Association, The National Association of Children's Hospitals and Related Institutions, Inc. (NACHRI), New Hampshire Hospital Association, Oregon Hospital Association, Rhode Island Hospital Association, Southern Kaiser Foundation Hospitals, Vermont Hospital Association and the Wyoming Hospital Association. Several individual hospitals throughout the United States have also sent data for special studies.

Hospitals participating in PAS from United States Territories and Puerto Rico are excluded from the series. Data from psychiatric hospitals are excluded because these facilities are not general hospitals. Data from psychiatric units within general hospitals are included. Pediatric hospitals are also included.

The characteristics of all hospitals with discharge data included in the Length of Stay tables are displayed in Table 1. Table definitions are as follows:

Region and Census Division

The regional volumes of Length of Stay series are defined by four census regions as described in the map below.



See Table 2 for the states comprising each region and the number of hospitals and patients included in each volume.

Urban/Rural Hospitals

Urban hospitals are those with a metropolitan statistical area designation on the 1987 AHA magnetic tape. Hospitals without a metropolitan statistical area designation represent rural hospitals.

Teaching Intensity

The teaching designation is determined by a weighted index measuring program intensity developed by Phillip and Hai.[1] The index is based on programs, memberships, and affiliations approved by various bodies. The approvals incorporated in the index are:

- Accreditation by Joint Commission on Accreditation of Healthcare Organizations
- Cancer Program approved by American College of Surgeons
- Residency approved by American Medical Association
- Medical School Affiliation reported by American Medical Association
- Hospital-controlled professional nursing school, reported by National League for Nursing
- Member of Council of Teaching Hospitals of the Association of American Medical Colleges

Based on this index, hospitals are classified by one of three teaching status groups:

1. Low Teaching Intensity Hospitals
2. Medium Teaching Intensity Hospitals
3. High Teaching Intensity Hospitals

ORGANIZATION OF LENGTH OF STAY TABLES

Classification System

The length of stay tables are organized according to CPHA's diagnosis and procedure classification system. The Diagnosis classification system is called *ICD-9-CM List A: Hospital Diagnosis Groups*[1]. Within each diagnosis group, patients are stratified by single or multiple diagnosis, operated or nonoperated status, and age. For diagnosis groups 411-413, which pertain exclusively to newborn, age is replaced by birth weight in grams. The Operation classification system is called *ICD-9-CM List B: Hospital Procedure Groups*. Within each procedure group, patients are stratified by single or multiple diagnosis and age.

NOTE: The composition of List A Diagnosis and List B Procedure groups in the 1988 Length of Stay series has been revised to reflect advances in medical technology and current trends in clinical medicine. The title of each group includes a brief English description and *ICD-9-CM* codes that fall into that group. Where space is limited, a full description can be found in the Appendix. For tracking purposes, a crosswalk from the old Diagnosis and Procedure groups is provided in Part III of the Index at the back of the book.

Patient Data Assignment

Diagnosis and procedure information for all patient data included in this book is coded using *ICD-9-CM*, updated as of October 1988.

Patient data are assigned an *ICD-9-CM* List A group on the basis of the principal diagnosis. This is the diagnosis that, after study, explains why the patient was admitted to the hospital. The principal procedure is one that was performed for definitive treatment rather than one performed for diagnosis or exploratory purposes, or was necessary to take care of a complication.[2]

Definition of Multiple Diagnosis Patients

Patients are classified in the multiple diagnosis category if they had at least one valid secondary diagnosis in addition to the principal one. The following codes are not considered valid secondary diagnoses for purposes of this classification:

1. Manifestation codes (conditions that evolved from underlying diseases [etiology] and are in italics in *ICD-9-CM* Volume 1)[3]
2. Codes V27.0-V27.9 (outcome of delivery)
3. E codes (external causes of injury and poisoning)

Definition of Operated Patients

In the diagnosis tables, operated patients are patients who had at least one significant surgical procedure. The procedure may or may not relate to the principal diagnosis.

In the procedure tables, operated patients are those whose principal procedure fell into an *ICD-9-CM List B* group where at least one significant procedure was present. These tables contain procedures which are either therapeutic to the principal diagnosis or the only procedure listed.

[1] *ICD-9-CM List A: Hospital Diagnosis Groups and ICD-9-CM List B: Hospital Procedure Groups* are based on the *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM)*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1986.

[2] As defined by the American Hospital Association in the 1984 Revision of the Uniform Hospital Discharge Data Set.

[3] *International Classification of Diseases, 9th Revision, Clinical Modification (ICD-9-CM), Volume 1, Diseases: Tabular List*, Commission on Professional and Hospital Activities, Ann Arbor, Michigan, 1986.

While most List B groups contain only significant procedures, the following tables contain significant, as well as other procedures: 547, 556, 575, 576, 582, 587, 609, 615, 621, 628, 632, 641, 652, 653, 661, 674, 687, 690, 694, 698, 704, 716, 717, 774, 775, 777, 778, 782, 783. Because of their mixed composition, these tables are included for information purposes only.

List B tables which contain no significant procedures are identified with a disclaimer explaining why these tables cannot be used for purposes of examining length of stay.

EXPLANATION OF STATISTICS

The List A diagnosis group titles and List B procedure group titles heading the tables are followed in parentheses by the *ICD-9-CM* diagnosis or procedure codes included in that List A or List B group.

Data are categorized by total patients, their average length of stay, the variance, and distribution percentiles. Patients are stratified by single or multiple diagnoses (Dx), operation status, and age. In addition, two subtotals and a grand total are included.

Total Number of Patients

This number represents the total number of patients in the stratified group. Patients with stays over 99 days (99+) are not included.

Average Length of Stay

The length of stay is calculated from the admission and discharge dates by counting the day of admission as the first day. The average is figured by adding the length of stay for each patient and then dividing by the total number of patients. Patients discharged on the day of admission are counted as staying one day in the calculation of average length of stay. Patients with stays over 99 days (99+) are excluded from this calculation.

Variance

The variance is a measure of the spread of the data around the average. For these tables, the smallest variance is zero, indicating all lengths of stay are equal.

When using tables in which there is a large variance, and the patient group size is relatively small, the average stay may appear high. This sometimes occurs when one or two patients with long hospitalizations fall into the group.

Distribution Percentiles

A length of stay percentile for a stratified group of patients is determined by arranging the individual patient stays from low to high. Counting up from the lowest stay to the point where half of the patients have been counted yields the value of the 50th percentile. Counting off one-tenth of the total patients gives the 10th percentile, and so on.

The 10th, 25th, 50th, 75th, 90th, 95th, and 99th percentiles of stay are displayed in days. If, for example, the 10th percentile for a group of patients is four, it means that 10 percent of the patients stayed four days or less. The 50th percentile is the median. Any percentile with a value of 100 days or more is listed as 99+.

Patients who were hospitalized 99+ days or longer are not included in the total patients, average stay, and variance categories. The percentiles, however, do include these patients.

Subtotal and Grand Total

The subtotal represents the total patients in each of the single or multiple diagnosis, operated or nonoperated categories. The Grand Total represents the total number of patients in the specified diagnosis or procedure category.

APPLICATION OF LENGTH OF STAY TABLES

The *Length of Stay* series can be used as a valuable reference source in a variety of healthcare settings. Use of stay data allows healthcare professionals to compare regional and national norms to their own institution or client. The *LOS* series assists in projecting extended stay reviews, while recommending the most effective use of patient care services. Norms from other editions of the *LOS* series create the opportunity to establish baselines as far back as 1963 to forecast and plan for future service demands.

The following steps are intended to provide a guide in situations where a healthcare professional wishes to determine a reasonable length of stay:

Step 1: Consult the index at the back of the appropriate *Length of Stay* for the particular diagnosis or operation to be reviewed.

Step 2: Find the corresponding table in *Length of Stay*. The group number precedes the title of each table.

Step 3: Depending on the purpose of the review, find the appropriate portion of the table:

Single or Multiple Diagnoses

Not Operated or Operated (for Diagnosis groups only)

Patient's Age on Day of Admission

Step 4: Find the 50th percentile of stay for similar patients at the point where the 50th percentile column of the table intersects the horizontal line containing the pertinent patient variables.

Step 5: Consult the total patient sample (Grand Total) and variance to consider the homogeneity of the data, i.e., to what extent length of stay averages are clustered or spread out within a particular patient group.

These general steps are followed, in more specific application, by healthcare professionals in many diverse settings. LOS tables can be used to identify candidates for utilization review, to furnish check points in patient care, to project extended stay reviews and to improve hospital care standards. Concern for quality care and cost containment make the Length of Stay tables an essential tool in the healthcare industry.

TWENTY-FIVE YEARS OF LENGTH OF STAY

Now in their 25th year, the *Length of Stay* publications are drawn from a unique database of hospital medical experience. The original series in 1963-64 utilized discharge records submitted to CPHA through the Professional Activity Study. The 1988 *LOS* series, published by HKS with data from PAS hospitals and hospital associations, is based on over five million patient records, representing almost 20 percent of the short-term, nonfederal hospitals in the United States.

With LOS data, healthcare professionals can track trends over time and examine current patterns of inpatient hospitalization. For a broad perspective, total days spent in the hospital for various conditions can be compared from the earliest data (1963-64) to the current data (1988). For example, average stay for a diagnosis of diabetes mellitus without complications which was 11.3 days in the 60's, dropped to 5.1 days in 1988.

The following table illustrates hospital stay over a ten year period:

As expected, there is a steady decline over the time period with almost a 15% decrease, from an average stay of 6.7 days in 1979 to 5.7 days in 1988. A slight levelling off can be observed since 1986. Regional variations remain consistent, with hospital stays highest in the Northeast and North Central, and lowest in the South and West.

A specific example of this pattern is evidenced in the table below which displays length of stay for normal delivery (ICD-9-CM 650) from 1980 through 1988. This table illustrates the overall decline in length of stay as well as the regional variations described above:

AVERAGE LENGTH OF STAY: NORMAL DELIVERY UNITED STATES AND REGIONS, 1980-1988

There has been a corresponding decline for surgical hospital stays. The following table illustrates the average length of stay since 1980 for frequently performed surgeries in the United States:

AVERAGE LENGTH OF STAY: SPECIFIC SURGERIES UNITED STATES 1980-1988

Researchers have looked at a variety of factors to explain the decline in hospital stay. Clearly one incentive to decrease stay resulted from the federal government's implementation of a fixed price prospective payment system (PPS) to reimburse hospitals for inpatient costs by Medicare patients. The effect of PPS is demonstrated in studies showing that between 1980 and 1985 Medicare beneficiaries have the greatest relative decline in stay. LOS data show increasingly shorter stays throughout the 80's with the most significant drop occurring between 1983 and 1984. Length of stay dropped 0.4 days for all U.S. hospitals over that year, and continued downward an additional 0.2 days in 1985.

In the 1980's new medical technologies have shortened the number of days a patient needs to be in the hospital. For example, the use of arthroscopic surgeries on the knee has decreased significantly the length of stay in U.S. short-term hospitals. Length of stay data for both internal derangement of the knee joint and dislocation of the knee show a decline from more than 4 days in 1980 to 2.5 days in 1988. Similarly the advent of chemoneucleolysis for herniated discs has reduced hospital stay dramatically.

Issues of cost containment have led to greater scrutiny over hospital stay, translated into the practice of discharging patients as soon as it is medically acceptable. Evidence of this practice is particularly clear for patients receiving medical/surgical procedures. Routine pre-operative examinations are now performed on an outpatient basis prior to admission. Post-operative stay has been shortened, with an increasing reliance on transfer to an alternative care facility after discharge.

The proliferation of HMO's and PPO's may provide yet another explanation for reduced inpatient days. With medical services now being prepaid, the incentive is to closely monitor all service delivery and to reduce costly hospital stays whenever possible.

Length of stay data are only one indicator of inpatient costs. This annual publication of norms from the CPHA database serves a significant function in offering a consistently reliable measure for review and analysis.
